

REMINGTON'S ARMY AND NAVY REVOLVER.

ALBERT E. CRANE,
AGENT FOR PACIFIC COAST, SAN FRANCISCO, CAL.

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use.

Upwards of 150,000 have been supplied to the Government since 1861, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequalled range and penetration, together with its durability, are points in its favor now well-known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a **SINGLE PIECE OF METAL**, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishing a **TOP STRAP** or support above the cylinder, serves to protect the base pin (on which the cylinder revolves), from any undue strain to which it would otherwise be subjected, and which would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by quick adjustment of the cylinder, one pistol can be made as effectual as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver, which a trial of the arm is only needed to attest.
