

**T**HE water heating problem has been a hard one but the DEASY HEATER has solved it.

This Heater is of California design and workmanship and is superior to any water heater made, not only in economy of gas but in quietness with which temperature of water can be raised.

The cut in this page fully illustrates its construction and method of operation.

Thirty gallons of water can be heated to a temperature of 180° F. in thirty minutes with a consumption of thirty cubic feet of gas.

Within thirty seconds after lighting, hot water is available, making it especially an instantaneous heater. Ten cubic feet of gas will furnish hot water enough for a bath.

The heater is simple—pointing to gas will order. It solves the hot water problem in the gas kitchen.
