

# BYRON JACKSON

MANUFACTURER OF

## JACKSON'S ACME STACKER, LOADER & RAKES.

The "Acme" stacks hay, grain or straw, or loads it on wagons, at about one third usual cost. It takes the hay from the swath (or from the cock or windrow) and puts it on the stack without manual labor. It builds high and compact stacks, which turn the rain, and the rapidity with which a crop can be harvested insures its safety. The hay is of a good color and not dry and brittle. Six men and ten horses put up 100 tons a day. With the "Acme" Rake the grain is not shattered out as when taken up with a fork. They have been tried in every kind of hay and grain; are a success in reaped grain. They are the best for unloading header wagons with nets, for which purpose a net attachment is used. They lift the net from the header bed, and, after dumping, spread it back in wagon. Cheapest machine and cheapest to operate. Improved and adapted to this Coast. Every improvement tested and every machine guaranteed.

The Rakes are the best in the world! They carry from 300 to 1300 pounds, and dump the load automatically. Teeth are iron pointed to prevent splitting. The drivers' weight balances the load so it can be carried easily. The Stacker weighs 1700 lbs., costs \$150; the Rakes weigh 650 lbs., cost \$50 each; Net attachment to unload header bed weighs 640 lbs., costs \$50; Nets, \$6 each. Satisfaction guaranteed. If you are interested, write me for circulars free. I own, for this Coast, the original patents covering this plan of stacking. Beware of infringements. Address
